SKILLS & INTERESTS

- **Languages** : Python, Java, Kotlin, Golang, JavaScript/TypeScript
- **Backend** : Flask, FastAPI, Spring Boot, Node.js, OpenAPI, OPA/Rego, RabbitMQ
- **Data** : PostgreSQL, SQLite, MongoDB, CouchDB, Redis, DynamoDB
- **Infrastructure** : Kubernetes, Docker, kOps, Azure AKS, AWS
- **Observability** : Splunk, Grafana, OpenTelemetry, Opsgenie
- **Frontend** : React, React Native, Three.js, Leaflet

WORK EXPERIENCE

Atlassian

Dec. 2022 – May 2025

Backend Developer

Bangalore, IN

- Built detection systems for spam/abuse using OPA policies in Golang and Rego, protecting millions of users from bad actors.
- Wrote gibberish-detection algorithms to flag spammy sites before they reached customers
- Built a new Kotlin/Spring Boot service from the ground up — handled the business logic, hooked it into other teams' systems, kept it running reliably in production.
- Built a pipeline failure detection system on top of Splunk's API that caught failures early and cut customer impact.
- Shipped the BETA of data residency for marketplace apps — owned the engineering end to end, including test planning.

Klinify

Dec. 2020 – Dec. 2022

Senior Backend Engineer, Backend Developer

Singapore

- Rewrote core APIs from Flask to async Uvicorn, cutting compute costs in half while scaling to 10K requests/sec.
- Built a FHIR terminology service in Java/Spring Boot on top of open source code — cut the project timeline by 80% and dropped vendor costs by 90%.
- Added Redis caching to the heaviest endpoints, cutting load times by 90%.
- Refactored a 200K-line codebase to be OpenAPI-compliant, backed by pytest coverage.
- Built an unsubscribe/campaigning service in TypeScript. (Node.js)
- Ran Kubernetes clusters across multiple availability zones on Azure AKS, kept uptime solid as the customer base grew.

Roado

Jan. 2020 – Dec. 2020

Full Stack Developer, Infrastructure Engineer

Bangalore, IN

- Setup OSRM (routing) and Nominatim (geocoding) in production on OpenStreetMap data.
- Built a dynamic Excel generation system for bulk uploads, with programmatic VBA injection and Excel-JSON conversion — onboarded high-value customers with it. (Node.js)
- Migrated infrastructure to containerized microservices on Kubernetes using **kOps** on **AWS**.
- Moved bulk upload processing to RabbitMQ workers so large jobs ran async instead of blocking the request path.
- Built a custom analytics dashboard calculating business metrics in real time. (Node.js)
- Migrated Google Maps to Leaflet, cutting map costs by 90%.

Freelancing

- Built a data scraping pipeline (Selenium, TinyDB, Electron) that processed 2 million records.

EDUCATION

A.D. Patel Institute of Technology

Sept. 2016 – Oct. 2020

Computer Engineering

Anand, GJ

- CGPA : 8.43
- Co-developed the official social platform for our college, using **React Native and GoLang**.
- Hypothesized a Logical Error Detection System based on GPU K-Nearest Neighbors.

ACHIEVEMENTS

- Winner of Smart Gujarat Hackathon 2018, a government funded hackathon that involves solving issues faced by the state government's departments. Developed an Attendance System using **Facial Recognition** that required minimal cost.
- Ranked under **Top 40 teams all India** in TCS Enginix, a team based engineering contest that rewards innovative impactful solutions to real life problems.
